The Stirling engine (or Stirling's air engine as it was known at the time) was invented and patented in 1816. It followed earlier attempts at making an air engine but was probably the first put to practical use when, in 1818, an engine built by Stirling was employed pumping water in a quarry. The main subject of Stirling's original patent was a heat exchanger, which he called an "economiser ...

a Stirling engine to function as an electric generator. Stirling engines operate on a regenerative thermodynamic cycle where the working fluid is enclosed within the engine. Fluid flow is modulated by changing volumes within the engine. The two pistons of the engine are exposed to a hot source and cold source, respectively.
